3. Bootstrap Jumbotrons

http://getbootstrap.com/components/#jumbotron

Jumbotrons are everywhere. If you head to the Mindspark website, you'll see that we're actually using a Bootstrap jumbotron near the top with the computer and the Mindspark text. Jumbotrons are almost as widely used as navigation bars.

The bootstrap jumbotron is as follows:

```
1   <div class="jumbotron">
2     <h1>Hello, world!</h1>
3     <p>...</p>
4     <p><a class="btn btn-primary btn-lg" href="#" role="button">Learn
5   more</a></p>
6   </div>
```

...will give:

Hello, world!

This is a simple hero unit, a simple jumbotron-style component for calling extra attention to featured content or information.

Learn more

Regularly, jumbotrons have background photos. Here's how you implement one:

```
1   <div class="jumbotron" style="background-image: url('<!--Image URL
2   here - can be local or via http requests (or online URLs)-->');">
3     <h1>Hello, world!</h1>
4     <p>...</p>
5     <p><a class="btn btn-primary btn-lg" href="#" role="button">Learn
6   more</a></p>
```

```
    </div>
```

Implementing this jumbotron is far, far easier than navigation bars. The elements within the jumbotron `div` have absolute positions, so you can modify its margin dimensions to move it around.

Exercises	
Exercise 1	Create a new webpage with a fake brand name/image and fake tabs. Add a navigation bar to the top as well as a jumbotron with a stock photo downloaded from the internet, and fake words.
